

Problems

Answer Key

1. What is the force necessary to pull a 790 kg roadster up a 75° ramp?

$$F_g = mg$$

$$= (790 \text{ kg}) \left( 9.8 \frac{\text{m}}{\text{s}^2} \right)$$

$$= 7742 \text{ N}$$

$$F_{\text{eff}} = H \sin \theta = 0$$

$$= (7742 \text{ N}) \sin 75^\circ$$

$$= 7478 \text{ N}$$

$$F_g = 7742 \text{ N}$$

2. What is the magnitude of the force that would pull a block down a ramp at an angle of 30°.

800g  
^

$$F_g = mg$$

$$= 800g \times \frac{1g}{1000g} \times 9.8 \frac{\text{m}}{\text{s}^2}$$

$$F_g = 7.84 \text{ N}$$

$$F_{\text{eff}} = H \sin \theta$$

$$= (7.84 \text{ N}) \sin 30^\circ = 3.92 \text{ N}$$

# Worksheet: Inclined Planes

Complete the diagram, labeling vectors and angles:

1. A cart weighing 420 N rests on a 23° incline. Calculate the component of its weight that presses the cart to the hill. not pulls it down!

• looking for adjacent side  
CAH!  $H \cos \theta = \frac{A}{H}$

$$420 \text{ N} \cos 23^\circ = A = F_y = 387 \text{ N}$$

2. Calculate the parallel force component of the weight ( $6.1 \times 10^5 \text{ N}$ ) of a car resting on a hill which is 35° above horizontal.

$F_{\text{eff}} = F_x = F_{\parallel}$

$$F_{\text{eff}} = F_g \sin \theta = 6.1 \times 10^5 \text{ N} \sin 35^\circ = 3.50 \times 10^5 \text{ N}$$

3. A crate having a mass of 114 kg rests on a ramp with an angle of incline of 15.2°. What force does the crate exert perpendicular to the ramp?  $F_y = F_{\perp} = A$

$$F_g = mg = (114 \text{ kg})(9.8 \frac{\text{m}}{\text{s}^2}) = 1117.2 \text{ N}$$

$$F_{\perp} = H \cos \theta = (1117.2 \text{ N}) \cos 15.2^\circ = 1078 \text{ N}$$

4. What is the weight of a box that exerts a parallel force component of 330 N and a perpendicular component of 390 N?

$$a^2 + b^2 = c^2$$

$$(330 \text{ N})^2 + (390 \text{ N})^2 = c^2$$

$$108900 \text{ N}^2 + 152100 \text{ N}^2 = c^2 = \sqrt{c^2} = 261000 \text{ N}^2$$

What is the angle of incline of the hill  
 $C = 510.88 \text{ N}$

$$\tan \theta = \frac{D}{A}$$

$$\theta = \arctan \frac{D}{A} = \arctan \left( \frac{330 \text{ N}}{390 \text{ N}} \right) = 40.7^\circ$$
